HOW TO USE TEMPNFC BUTTONS AND LEDS

There are two buttons: START and INFO

There are two LEDs: `Green` and `Red`

Pressing INFO for at least 3 seconds will give the following LED behaviour:

a) `Green` and `Red` for 3 seconds: MEMORY FULL

b) `Red` flashing 3 times (700ms ON, 300ms OFF):

      1) NO DATA RECORDED
      2) ACQUISITION STOPPED
      3) WAITING FOR MANUAL START

c) `Green` for 3 seconds: MISSION OK

d) `Red` for 3 seconds: MISSION FAILED (temperature out of limits, mission duration exceeded limit)

Pressing START for at least 4 seconds will start the logger and Eds will behave as following:

a) `Red` for 3 seconds: DEVICE CANNOT BE STARTED

      1) MANUAL START NOT ENABLED
      2) AVAILABLE MISSIONS EXCEEDED (only for Single Use model) OR EXPIRY
CALIBRATION DATE EXCEEDED (only for TempNFC Calib model)

b) `Green` for 3 seconds: logger started correctly

When turning on the device (new battery or reset), `Green` and `Red` LEDs turn on and the memory is wiped out and default configuration is restored (calibration is not lost). While erasing the memory, the `Red` LED flashes.
